Bank and Payment Accounts Monitoring System
Aggregating application – Deployment and
maintenance instructions for data users

29 May 2026

1 Purpose of the instructions

The purpose of these instructions is to provide guidance data users regarding deployment and maintenance of the aggregating application.

2 Glossary and abbreviations

Term	Description
Bank and Payment Accounts Monitoring System	The national Bank and Payment Accounts Monitoring System is based on the Finnish Act on the Bank and Payment Accounts Monitoring System (571/2019) and on Directive (EU) 2018/843 of the European Parliament and of the Council on the prevention of the use of the financial system for the purposes of money laundering or terrorist financing. In accordance with the legal amendment 863/2025, The Bank and Payment Accounts Monitoring System is composed of a centralised automated account information system and centralised electronic system for account balance and transaction information.
Aggregating application	The aggregating application is an automated technical solution maintained by Finnish for transmitting data to competent authorities on grounds provided for in the Act on the Bank and Payment Accounts Control System.
Data retrieval system	Data retrieval system refers to the electronic bank and payment accounts data retrieval system maintained by a data supplier. It enables the data supplier to transmit data on their customers and customers' account balance and transaction information referred to in chapters 2 and 3 of the Act on the Bank and Payment Accounts Monitoring System, notwithstanding any secrecy provisions, to the competent authority. Data suppliers implement their own data retrieval systems, which means that there are several data retrieval systems. Finnish Customs determines the technical requirements for the data retrieval system.
Bank and Payment Accounts Register (Accounts Register)	The Bank and Payment Accounts Register (Accounts Register) is a system implemented and maintained by Finnish Customs that receives and stores the data referred to in the Act on the Bank and Payment Accounts Monitoring System.
Data user	Data user is the competent authority or bar association specified in the Act on the Bank and Payment Accounts Monitoring System that has the right to process data transmitted using the Bank and Payment Accounts Monitoring System.

Bank and Payment Accounts Monitoring System
Aggregating application – Deployment and
maintenance instructions for data users

29 May 2026

Term	Description
Data supplier	Data supplier refers to a party obligated by the Act on the Bank and Payment Accounts Monitoring System to submit information on their customers to the competent authority or bar association through the Bank and Payment Accounts Monitoring System. Data supplier also refers to a Finnish branch office of a foreign payment institution, electronic money institution, credit institution or provider of crypto asset services.
Controller	The Act on the Bank and Payment Accounts Monitoring System establishes Finnish Customs as the controller of the aggregating application and the Accounts Register. In data retrieval systems, controllers are decentralised: a data supplier, as a controller, is responsible for the availability of data by maintaining a data retrieval system, and the competent authority, as a controller, is responsible for the data it processes using the Bank and Payment Accounts Monitoring System.
Testing	Testing measures required in deploying the aggregating application. Customs maintains a testing environment for testing the aggregating application. The data supplier is responsible for creating the test material.
Maintenance	Maintenance refers to tasks entrusted with the controller of the aggregating application (Finnish Customs), such as service level control relating to the aggregating application, user support, disruption management, troubleshooting, access management as well as version and change management.

3 Background and coverage

According to Directive (EU) 2018/843 of the European Parliament and Council, Member States are required to establish centralised automated mechanisms for accessing national information on the identity of holders of bank and payment accounts and safe-deposit boxes. Consequently, Finland has approved a national Act on the Bank and Payment Accounts Monitoring System (571/2019).

In accordance with the legal amendment 863/2025, The Bank and Payment Accounts Monitoring System is composed of a centralised automated account information system and centralised electronic system for account balance and transaction information.

A centralised automated account information system refers to a centralised automated mechanism in accordance with Directive (EU) 2018/843 of the European Parliament and Council, allowing for immediate access to data on bank and payment accounts data as well as on safe-deposit boxes. A centralised electronic account balance and transaction information system refers to a EDP-based way to process account balance and transaction information from the Bank and Payment Accounts Monitoring System as well as securities information.

Bank and Payment Accounts Monitoring System

29 May 2026

Aggregating application – Deployment and
maintenance instructions for data users

The purpose of the Bank and Payment Accounts Monitoring System is to facilitate authorities' automated access to information regarding bank and payment accounts as well as safe-deposit boxes, to facilitate authorities' electronic access to account balance and transaction information and securities information as well as to improve the data security for the personal data to be supplied.

Personal data in the Bank and Payment Accounts Monitoring System are processed using the following:

- a bank and payment accounts data retrieval system
- the Bank and Payment Accounts Register (Accounts Register)
- a data disclosure system
- an aggregating application.

Through an electronic system, data can be accessed considerably faster than manually. Migrating to an electronic data transmission system will also enhance the data protection of businesses and citizens alike as log data concerning electronic data processing will be recorded in the aggregating application. Another aim is to improve the data quality. Manual collection of data poses a greater risk of errors than what would occur in an automated process. In other words, data retrieved through the Bank and Payment Accounts Monitoring System are more reliable and accurate.

4 Introduction of the aggregating application

The aggregating application is an automated technical solution maintained by Finnish for transmitting data to competent authorities on grounds provided for in the Act on the Bank and Payment Accounts Monitoring System. With the aggregating application, a data request made by a competent authority can be automatically transmitted to the data supplier and the data received from the data supplier can be transmitted to the competent authority.

Oversight of legality can also be carried out in the aggregating application, as Finnish Customs keeps records of the queries made by competent authorities.

4.1 Data in the aggregating application

The aggregating application provides a centralised access to the data in the Bank and Payment Accounts Monitoring System for the competent authorities. Via the aggregating application, a competent authority can retrieve data in accordance with chapters 2 and 3 of the Act on the Bank and Payment Accounts Monitoring System.

No other data on queries and responses besides log data are stored in the aggregating application.

The processing of personal data in the aggregating application is automatic. The data transmitted via the aggregating application must be deleted from the application as soon as the data has been transmitted onwards. Unless the competent authority has retrieved the requested data from the aggregating application using its data retrieval system within the time limit prescribed by Customs, the data is automatically deleted from the application.

Data suppliers are divided into two categories:

- category 1: credit institutions
- category 2: payment institutions, electronic money institutions and crypto-asset service providers

4.2 Role and responsibilities of Finnish Customs

Finnish Customs has the right provided for in the Act on the Bank and Payment Accounts Monitoring System to issue binding regulations on the technical requirements for the Bank and Payment Accounts Monitoring System as well as on how the data are to be certified.

Customs' technical responsibilities are directly derived from the legislation concerning the aggregating application.

According to the Act on the Bank and Payment Accounts Monitoring System, Customs acts as the controller of the personal data processed in the aggregating application. The controller is obligated to prove that the requirements set out in the EU's General Data Protection Regulation (GDPR) (2016/679) and the Finnish Data Protection Act (5.12.2018/1050) are complied with in data processing.

4.3 Responsibility for correctness of data

Data suppliers are responsible for the accuracy and correctness of data in their individual registers, and on correcting data found to be incorrect without undue delay.

5 Operators

Competent authorities and the bar association are data users.

Credit institutions, payment institutions, electronic money institutions and crypto-asset service providers are data suppliers. Data suppliers submit data either to the Accounts Register or through their own data retrieval systems to the aggregating application.

Table 1. Operators and roles relating to the aggregating application

Operators	Data supplier	Data user
Competent authorities and the Bar Association		x
Credit institutions	x	
Payment institutions	x	
Electronic money institutions	x	
Crypto-asset service providers	x	

5.1 Data user

The aggregating application is available to data users 24/7/365.

The organisations of data users must apply for the user rights for the aggregating application interface from Customs: tilirekisteri@tulli.fi.

5.2 Support provided by Customs

Customs provides support regarding the instructions, operational models and contents relating to the aggregating application.

maintenance instructions for data users

- See the guidance on the Customs website. [Bank and Payment Accounts Monitoring System](#).
- You can also contact Customs by email: tilirekisteri@tulli.fi.

6 Regulation and notification procedure

Customs has the right to issue regulations concerning the aggregating application.

Customs guides the organisations of data users in deploying the aggregating application.

7 Data security

Data users have an obligation to notify Customs without delay of any data security incidents and threats related to the aggregating application.

Data users must maintain log data of the update and query messages and store them in case of data security incidents. However, the actual content of the messages must not be saved in the log.

Customs stores the log data on the query and response messages concerning the aggregating application for the period required by legislation.

7.1 Data security – general

As the controller, Customs is responsible for the data security of the aggregating application. By various administrative and technical measures, Customs aims to prevent and minimise data security threats concerning unauthorised access to the aggregating application data.

Data users are responsible for

- the data security of their own data
- the data security of their own systems and connections
- for the data security of the systems and connections of any third party they use.

The data security of the aggregating application is based on the protection of the data connections using TLS encryption. The aggregating application identifies data users via server certificates.

The detailed requirements for creating and securing connections are specified in the technical interface descriptions of the aggregating application, the Accounts Registers and the data retrieval system.

Customs is responsible for ensuring that a data security audit is performed on the aggregating application. The auditing is based on the audit criteria used in central government as well as on commonly used application and platform security standards. The following criteria are used in the auditing, where applicable:

- Data security of the environment platforms (CIS Level 1)
- Data security of the selected applications (OWASP ASVS Level 2)
- Data security of the network (KATAKRI)
- Architecture (KATAKRI).

maintenance instructions for data users

7.2 Certificates

The external connections of the aggregating application are secured through certificates. Data users must obtain server and system signature certificates that meet the certificate requirements and install the certificates in their systems.

Technically, an individual certificate can be used both as a server certificate and as a signature certificate. Separate certificates can also be used. Typically, server certificates are installed in front-end servers that administer data communications, whereas signature certificates are installed in back-end servers that generate replies.

Certificates for data users are to be acquired by the party that generates and transmits queries submitted by data users. If a service provider is used for generating and transmitting queries on behalf of the data user, the server certificate is to be acquired by the service provider. In such cases, the data user must authorise the service provider to sign the messages to be sent.

7.3 Renewal of certificates

Data users must renew their certificates in good time before they expire. An expired certificate cannot be used.

A new certificate is to be submitted to Customs no later than one month before the deployment of the certificate, unless otherwise agreed with Customs. Send the certificate to Customs by email to tilirekisteri@tulli.fi

Customs must renew its own certificate on a regular basis with the certificate provider. Customs will notify of the time for renewal of certificates. The validity of server certificates can be checked from the certificate directory of the Digital and Population Data Services Agency (DVV).

8 Stages of deployment

The deployment of the aggregating application involves testing, opening of data connections as well as approval of the deployment.

8.1 Testing

Customs coordinates testing with data users. Customs maintains a testing environment for testing which data users can use in their testing procedures.

8.2 Approval

Before starting production use, the functionality of connections is ensured in production. Once the tasks related to the deployment have been carried out, Customs approves the move into production with a written notification.

9 Maintenance

Maintenance of the aggregating application comprises

- service level management
- support produced by Customs
- incident and change management
- version and configuration management of the aggregating application.

Data users must assign a contact person in their organisations, who Customs will contact regarding maintenance. Customs will inform the contact person of any changes to the service.

Bank and Payment Accounts Monitoring System

Aggregating application – Deployment and
maintenance instructions for data users

9.1 Service level

The aggregating application is available to data users around the clock. Users will be notified of any maintenance breaks in advance.

Customs has the right to make changes to the availability requirements. Users will be notified of any changes in advance.

9.2 Disruptions

Data suppliers, data users and Customs are obligated to inform other concerned parties of any malfunctions in their service that affect the functionality of the aggregating application.

In situations involving malfunctions, data suppliers and data users must notify Customs immediately (tilirekisteri@tulli.fi).

9.3 Change management

As the administrator of the aggregating application, Customs oversees changes and has the legal right to decide on and issue regulations on changes.

Customs reserves the right to change the content, execution and availability of the aggregating application. Customs also has the right to close the interface of the aggregating application for the duration of service and update measures. Customs will notify data suppliers and data users of any changes in advance.

Customs is not responsible for any inconvenience, costs or indirect damage due to loss of data or delays caused by any interruptions or disruptions in the system.

Customs updates the interface descriptions if there are changes to the interfaces. Customs also directly notifies the contact persons appointed by data suppliers and data users of any changes.

9.4 Version and configuration management

Version management entails management of major changes, whereas configuration management refers to smaller measures, such as modification of settings. These measures are carried out according to the standard procedures set out by Customs.

The table below describes the statuses of a specific interface version.

Table 2. Statuses of interfaces

Status	Meaning
Draft	Published and available, but the interface may change
Active	Change management practices for interfaces operational
Deprecated	Interface in production but about to be removed, new implementations

9.5 Access management

Customs is responsible for granting data suppliers' and data users' organisations access rights. Customs is also responsible for the access rights required for technical maintenance.

9.6 Time zone

The aggregating application uses Eastern European Time, which is used in Finland. Please note however, that you will receive the response messages in Greenwich Mean Time.
